PRODUCT NEWS

NEW DIAQUICK CHIKUNGUNYA IGG/IGM CASSETTE

Chikungunya is a viral infection transmitted by the bite of *Aedes aegypti*. It shares some clinical signs with Dengue, but lacks the severe haemorrhagic complications. WHO encourages countries to implement CHIK diagnostics, as it is important to clinically distinguish the diseases. The DIAQUICK Chikungunya IgG/IgM Cassette offers the following features:

- ◇ Storage at room temperature, stable for up to two years
- ◇ Separate detection of IgG and IgM antibodies
- ◇ Good correlation with ELISA methods

IMPROVED URIC ACID AOX:

Due to a better ascorbate tolerance, shelf life of Uric Acid AOX could be prolonged to 24 months from date of production. All other reagent characteristics remain unchanged. There is no change in assay procedure or instrument application and no impact on performance, recovery of control sera or patient results.

We expect the first lot with longer shelf life available in February 2017.

DISCONTINUED PRODUCTS:

DOA Multi-6 HS Touch Test
D-Dimer Calibration Kit
D-Dimer Control High & Low
ToRCH IgM Combo Cassette
